## CONFIGURATION OF NODE-RED TO SEND COMMANDS TO IBM CLOUD

Here we add two buttons in UI

1 -> for motor on

2 -> for motor off

We used a function node to analyse the data received and assign command to each number.

The python code for the analysis is:

```
if status == "motoron":
    print ("motor is on")
elif status == "motoroff":
    print ("motor is off")
else :
    print ("please send proper
command")
```

### Code:

```
import time
import sys
import ibmiotf.application
import ibmiotf.device
import random

#Provide your IBM Watson Device
Credentials

organization = "obbnyv"
deviceType = "raspberrypi"
deviceId = "123456789"
```

```

authMethod = "token"
authToken = "12345678910"

# Initialize GPIO

def myCommandCallback(cmd):
    print("Command received: %s" %
cmd.data['command'])

    status=cmd.data['command']

    if status == "motoron":
        print ("motor is on")
    elif status == "motoroff":
        print ("motor is off")
    else :
        print ("please send proper
command")

try:
    deviceOptions = {"org":
organization, "type": deviceType, "id":
deviceId, "auth-method": authMethod,
"auth-token": authToken}

    deviceCli =
ibmiotf.device.Client(deviceOptions)

    #.....

except Exception as e:
    print("Caught exception
connecting device: %s" % str(e))

    sys.exit()

# Connect and send a datapoint "hello"
with value "world" into the cloud as an

```

```
event of type "greeting" 10 times
deviceCli.connect()
```

```
while True:
```

```
    #Get Sensor Data from DHT11
    ph=random.randint(3,9)
    moisture=random.randint(0,110)
    temperature=random.randint(-
20,125)
    Humid=random.randint(0,100)

    data = {'ph':ph, 'moisture':
moisture, 'temperature' : temperature,
'Humid': Humid }

    #print data

    def myOnPublishCallback():

        print ("Published Soil Moisture
= %s %% " %moisture,"Temperature =
%s C" % temperature, "Humidity = %s
%% " % Humid, "ph: %s "%ph, "to
IBM Watson")
```

```
    success =
deviceCli.publishEvent("IoTSensor",
"json", data, qos=0,
on_publish=myOnPublishCallback)

    if not success:

        print("Not connected to IoTf")

        time.sleep(10)
```

```
    deviceCli.commandCallback =
myCommandCallback
```

# Disconnect the device and application  
from the cloud

```
deviceCli.disconnect()
```

## Output:

The screenshot shows the Spyder Python IDE interface. The left pane displays a Python script with the following code:

```
19 print ("motor is on")
20 elif status == "motoroff":
21     print ("motor is off")
22 else :
23     print ("please send proper command")
24
25 try:
26     deviceOptions = {"org": organization, "type": deviceType, "id": deviceId, "auth-method": authMeth
27     deviceCli = ibmiotf.device.Client(deviceOptions)
28     #.....
29
30 except Exception as e:
31     print("Caught exception connecting device: %s" % str(e))
32     sys.exit()
33
34 # Connect and send a datapoint "hello" with value "world" into the cloud as an event of type "greetin
35 deviceCli.connect()
36
37 while True:
38     #Get Sensor Data from DHT11
39     ph=random.randint(3,9)
40     moisture=random.randint(0,110)
41     temperature=random.randint(-20,125)
42     Humid=random.randint(0,100)
43
44     data = {'ph':ph, 'moisture': moisture, 'temperature': temperature, 'Humid': Humid }
45     #print data
46     def myOnPublishCallback():
47         print ("Published Soil Moisture = %s %%" %moisture,"Temperature = %s C" % temperature, "H
48
49     success = deviceCli.publishEvent("IoTSensor", "json", data, qos=0, on_publish=myOnPublishCall
50     if not success:
51         print("Not connected to IoTF")
52         time.sleep(10)
53
54     deviceCli.commandCallback = myCommandCallback
55
56 # Disconnect the device and application from the cloud
57 deviceCli.disconnect()
58
```

The right pane shows the console output, which displays a series of log messages including sensor data points and command responses:

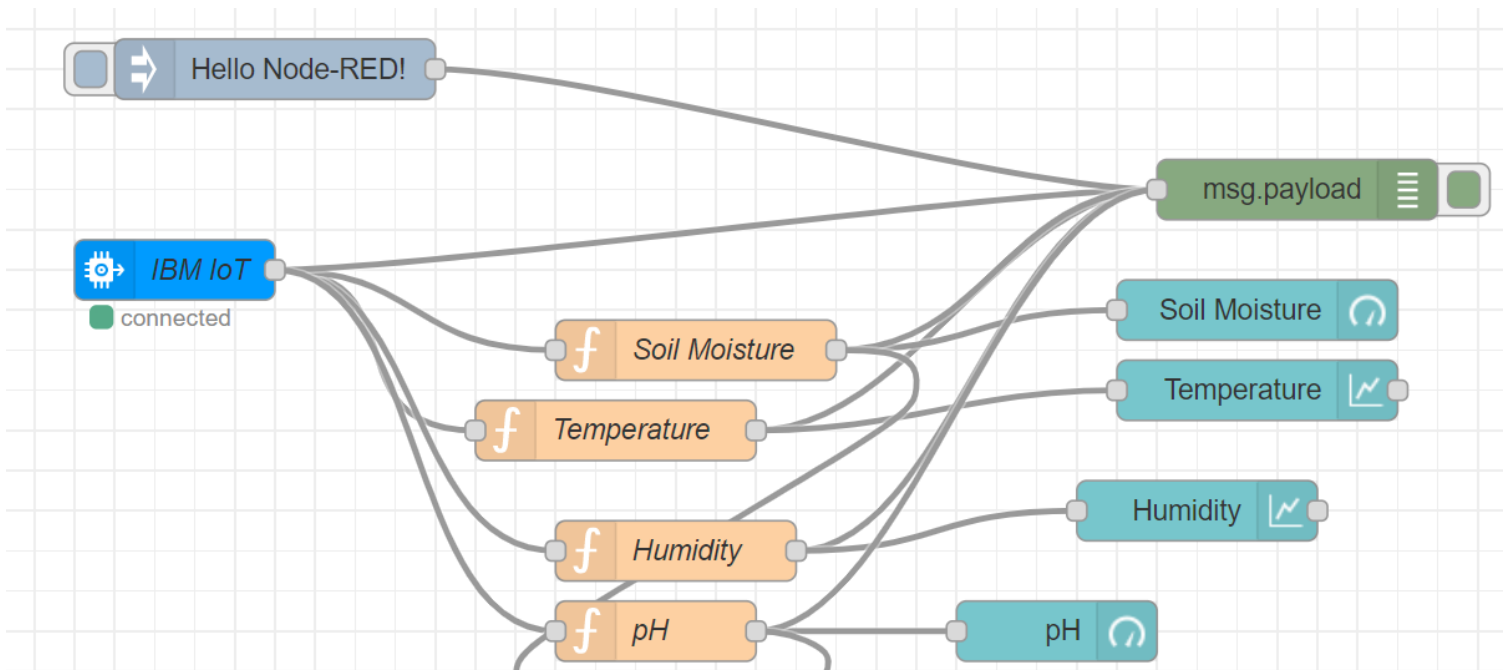

```
Published Soil Moisture = 79 % Temperature = 113 C Humidity = 13 % ph: 9 to IBM Watson
Published Soil Moisture = 68 % Temperature = 92 C Humidity = 16 % ph: 4 to IBM Watson

Command received: motoron
motor is on
Command received: motoroff
motor is off
Published Soil Moisture = 92 % Temperature = 77 C Humidity = 81 % ph: 5 to IBM Watson
```

## Adjusting User Interface

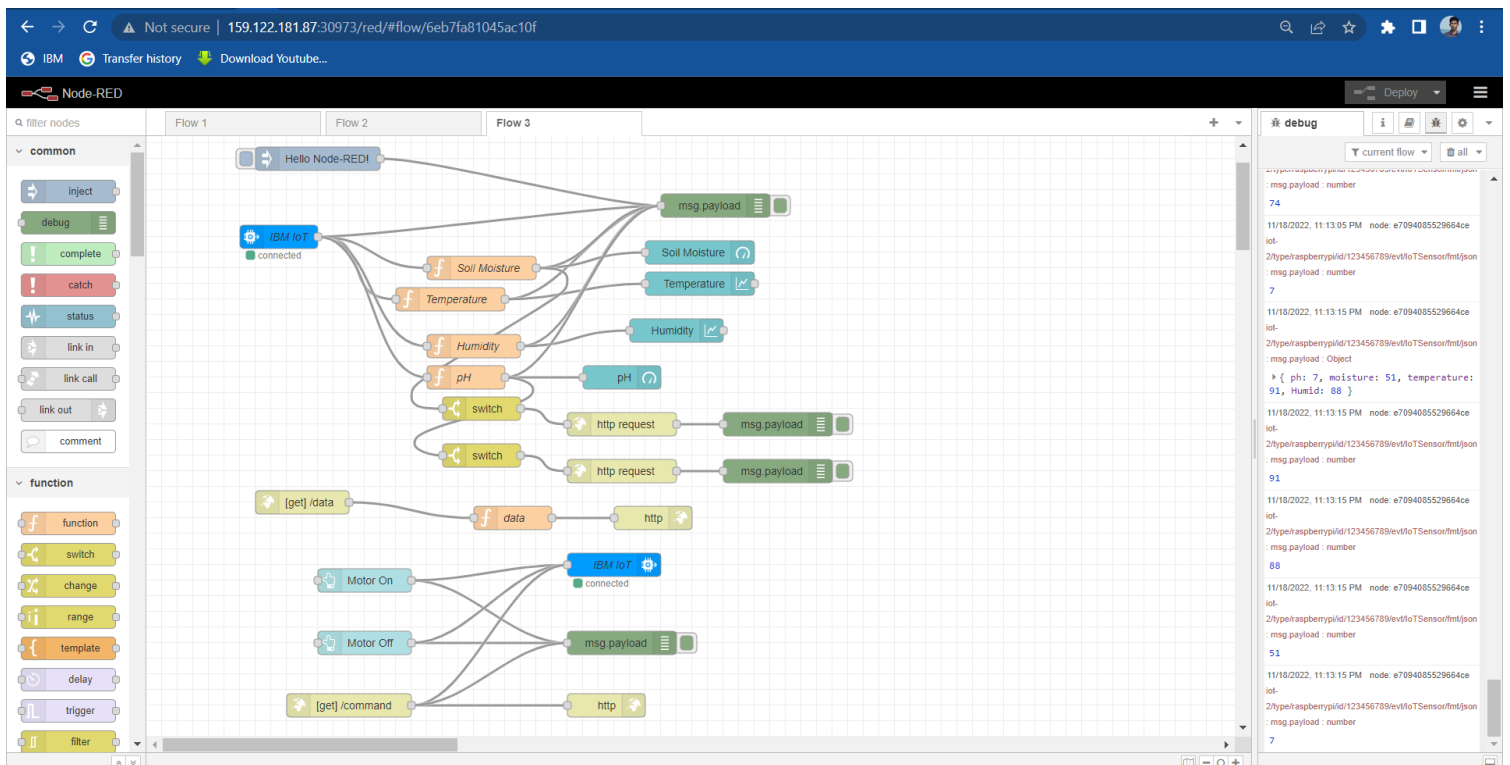

In order to display the parsed JSON data a Node-Red dashboard is created.

Here we are using Gauges, text and button nodes to display in the UI and helps to monitor the parameters and control the farm equipment.

Below images we started to create the flow 1

## COMPLETE PROGRAM FLOW:

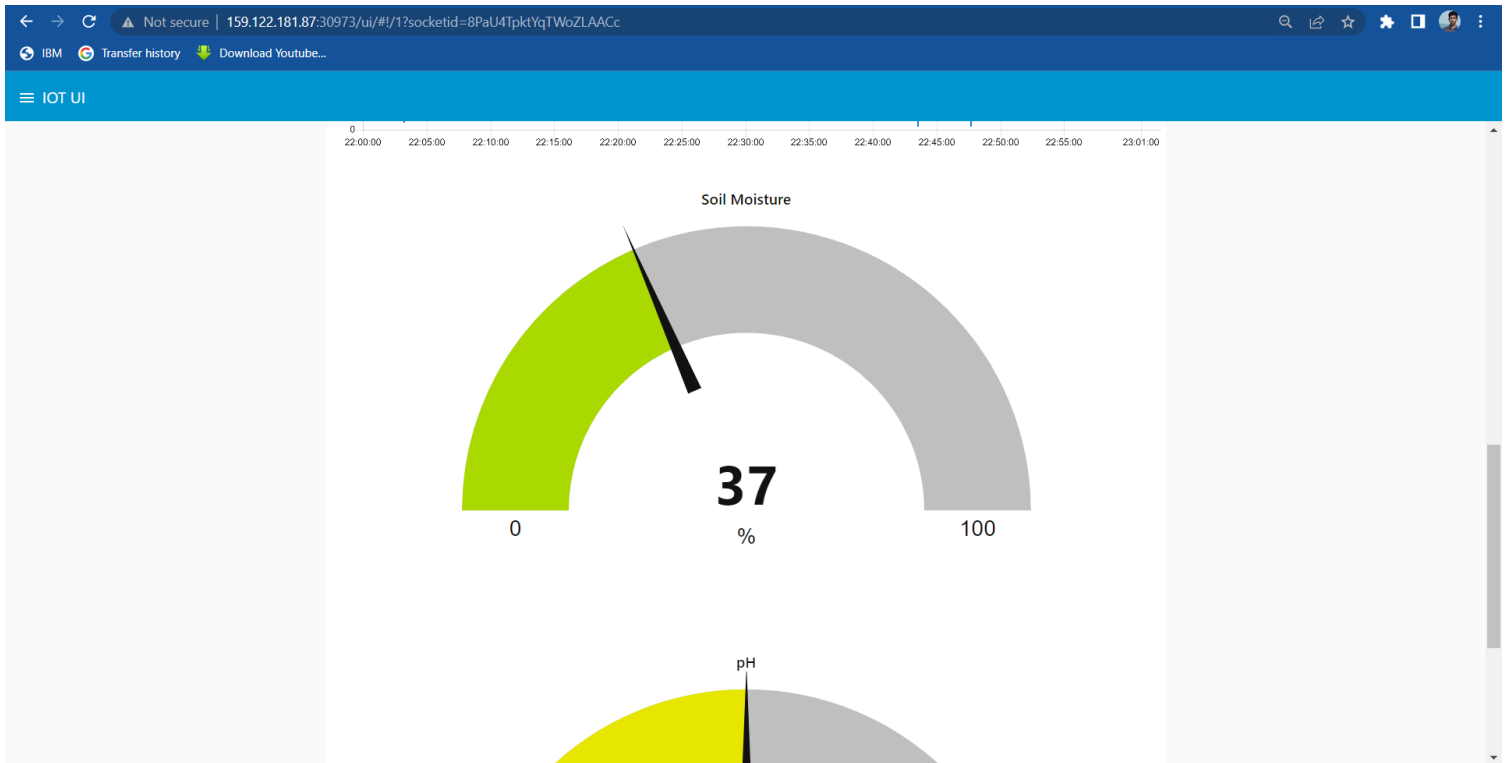

## HTML Response:

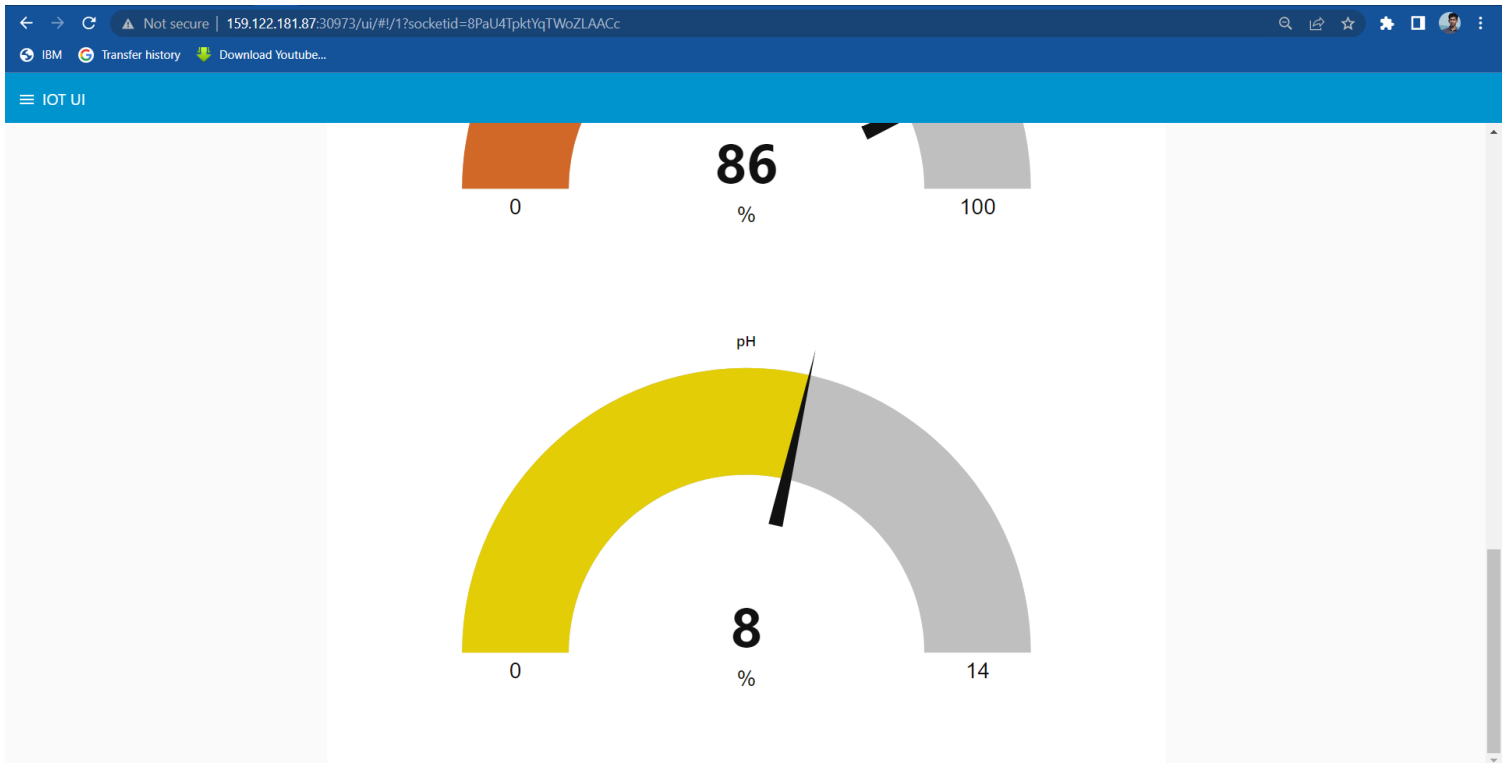

```
{"pH":5,"Soil":109,"Temperature":15,"Humid":43}
```

## UI Dashboard:

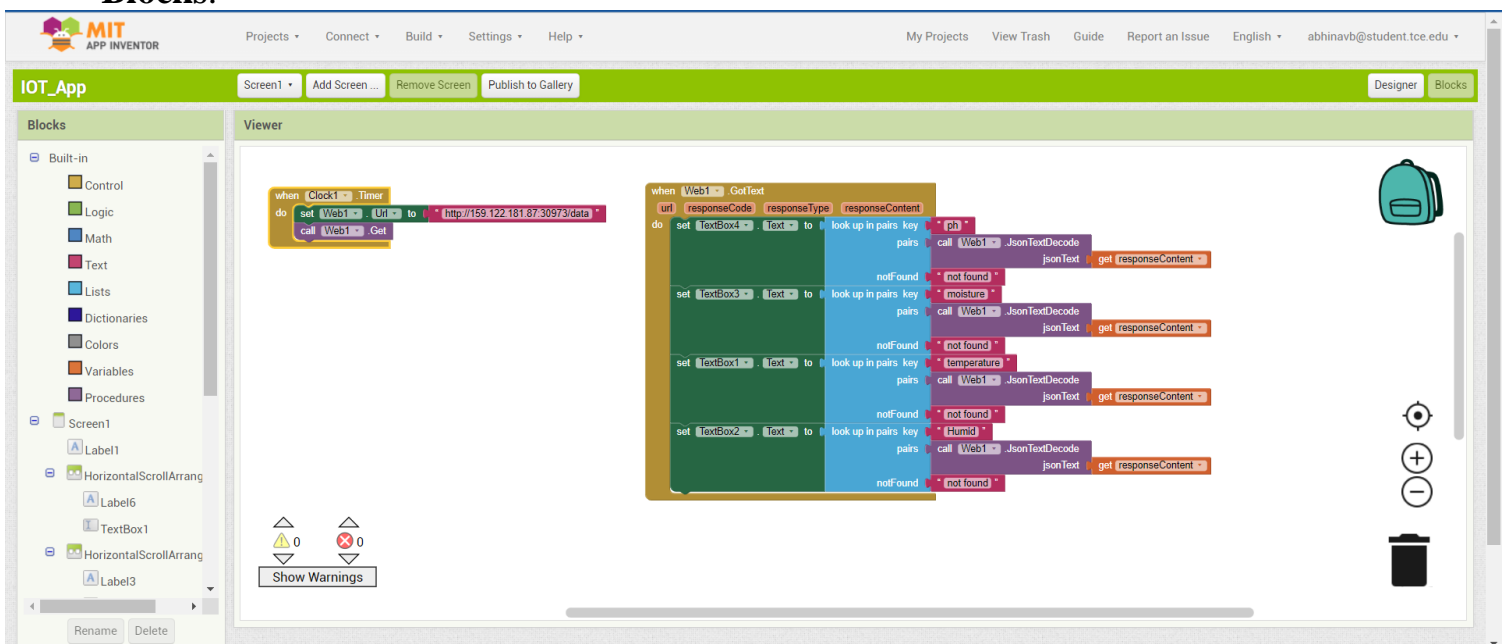

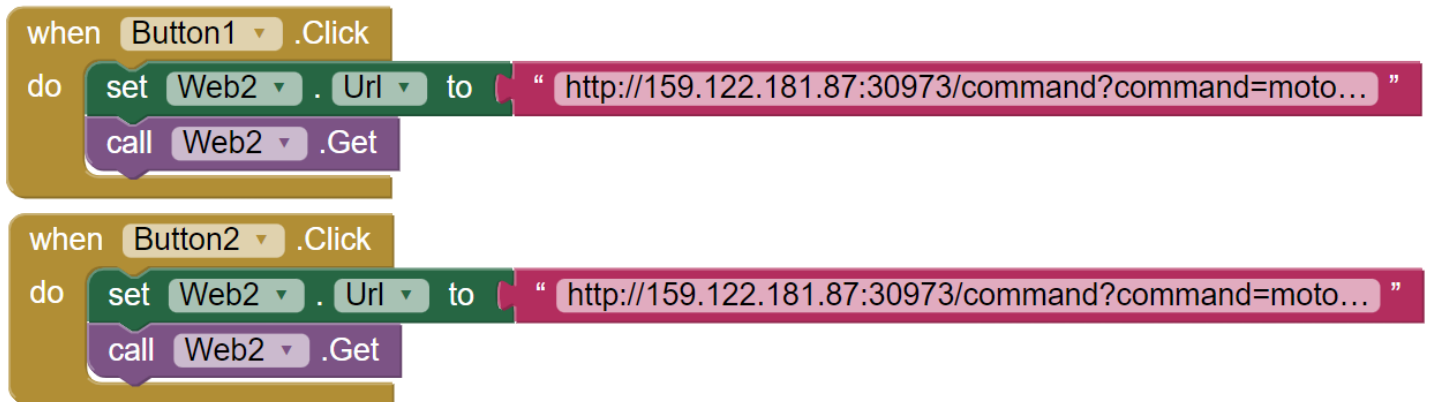

## MIT App Inventor:

MIT App Inventor is an intuitive, visual programming environment that allows everyone even children to build fully functional apps for smartphones and tablets. Those new to MIT App Inventor can have a simple first app up and running in less than 30 minutes. And what's more, our blocks-based tool facilitates the creation of complex, high-impact apps in significantly less time than traditional programming environments.
